## **APPLICATION**

This is a forced air gas furnace for indoor installation in building constructed on site. The furnace installation must conform with local building codes and ordinances or, in their absence with the National Fuel Gas Code, ANSI Z223.1-latest edition, and the National Electrical Code, ANSI/NEPA 70-latest edition. It is the personal responsibility and obligation of the purchaser to contract a qualified installer to assure that installation is adequate and is in conformance with governing codes and ordinances.

# STANDARD ORIFICE SIZING AND HIGH ALTITUDE DERATE

Rating of gas utilization equipment are based on sea level operation and need not be changed for operation at elevations up to 2,000 feet. For operation at elevations above 2,000 feet and, in the absence of specific recommendations from the local authority having jurisdiction, equipment ratings shall be reduced at the rate of 4 percent for each 1,000 feet above sea level before selecting appropriately sized equipment. (Ref. ANSI Z223.1-latest edition, Par. 8.12). See Table 1.

TABLE 1

## LOCATING THE FURNACE

When selecting a location for the furnace, observe the following rules.

- 1. The furnace should be set on a level floor. If the floor may become damp or wet at times, the furnace should be supported above the floor using a concrete base, bricks, patio blocks, etc., making sure adequate support is available for the furnace. Counterflow furnaces require the use of combustible floor base if installed on combustible surface. The combustible floor base is not part of the furnace and must be ordered separately. Furnace approved for installation on combustible flooring shall not be installed directly on carpeting, tile or other combustible material other than wood flooring.
- 2. The furnace should be as centralized as practical with respect to the air distribution system.
- 3. The vent pipe should be as short as practical but must be at least 3 feet and no more than 60 feet in total equivalent length to vent combustion products outdoors, (see Venting).
- 4. Provide at least the minimum clearances specified in Table 2 for fire protection, proper operation and service access. These clearances must be permanently maintained. The ventilating air openings in the front of the furnace must never be obstructed.

- 5. Fresh air for combustion must be piped from the outside to the connection on either the right or left side of the furnace (see Combustion Air).
- 6. Minimum service clearances must take precedence over fire protection clearances (minimum installation clearances).
- 7. All models are approved for a utility room or closet installation.
- 8. A gas-fired furnace installed in a residential garage must be installed so that the burners and ignition source are located not less than 18 inches above the floor, and the furnace must be located or protected to avoid physical damage by vehicles.

#### CAUTION

DO NOT locate furnace where temperature may drop below freezing as condensate may freeze resulting in improper operation or furnace damage.

#### CAUTION -

Do not store combustible materials near furnace or warm air ducts. The material may ignite by spontaneous combustion creating a fire hazard.

# TABLE 2 MINIMUM CLEARANCES (INCHES)

			4.5.1	INTERNET OF	DHIMMHIA	10 111010	30 /				
	Minimum Installation Clearances Min Service Clearances										
				Right	Left				Left	Right	
Model	Top	Front	Back	Side	Side	*Floor	Front	Back	Side	Side

CC100	i	б	0	<b>1</b>	0	NC	24	0	0	1	

<sup>\*</sup>C--Floor may be combustible material. Refer to "Locating The Furnace" page 1, item 1.

NC--Floor must be non-combustible. Can be installed on combustible flooring only when installed on special base part No. CFB-6 (CC060), CFB-7 (CC080), CFB-8 (CC100).

#### DUCT WORK

The air distribution system should be designed and installed in conformance with Manuals 7 or 7A published by Air Conditioning Contractors of American (ACCA), as set forth in their Manual K.

## topolic techniques CAUTION to label each in the factor to

When a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside the space containing the furnace, the return air must also be handled by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. This is to prevent drawing possible hazardous combustion products into the circulated air.

When the furnace is used in connection with a cooling unit\*, the furnace shall be installed parallel with or on the upstream side of the cooling unit to avoid condensation in the heating element. With a parallel flow arrangement, the dampers or other means used to control flow of air shall be adequate to prevent chilled air from entering the furnace and, if manually operated, must be equipped with means to prevent operation of either unit, unless the damper is in the full heat or cool position.

\*A cooling unit is an air conditioning coil, heat pump coil or chilled water coil.

### COMBUSTION AND VENTILATION AIR

This furnace is intended to use outside air for combustion. Failure to connect the air intake to the outside may result in premature failure of the heat exchanger. Figures 1, 3, 4 and 6 show a typical air intake connection. Connection of the air intake is a requirement for limited lifetime warranty of primary and secondary heat exchangers to be in effect. Refer to instructions on page 10 for combustion air intake. Consult local codes and ordinances for requirements applicable to your specific furnace installation conditions and comply with them. Provisions must be made for adequate combustion and ventilating air in accordance with Section 5.3, air for combustion and ventilation, of the National Fuel Gas Code, ANSI 2223.1—latest edition, or applicable provisions of the local building codes.

Adequate provisions for ventilating air must be made. If the furnace is installed in a closet or utility room, ventilating air must be allowed to enter the room through two permanent openings of equal area. One opening shall be located within twelve (12) inches of the ceiling and one opening within twelve (12) inches of the floor. Each opening shall have a face area of one (1) square inch per 1000 BTU/HR, but not less than 100 square inches.

#### CAUTION

When a furnace is installed in a closet or utility room, never use this room as a return air plenum.

#### **VENTING**

# Vent Resizing Instructions

When an existing furnace is removed from a venting system serving other appliances, the venting system is likely to be too large to properly vent the remaining attached appliances.

The following steps shall be followed with each of the appliances remaining connected to the common venting system, placed in operation one at a time while the other appliances remaining connected to the common venting system are not in operation.

- 1. Seal any unused openings in the common venting system.
- 2. Visually inspect the venting system for proper size and horizontal pitch and determine there is no blockage or restriction, leakage, corrosion, and other deficiencies which could cause an unsafe condition.
- 3. Insofar as is practical, close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any appliance not connected to the common venting system. Turn on any exhaust fans, such as range hoods and bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.
- Follow the lighting instructions. Place the appliance being inspected in operation. Adjust thermostat so appliance will operate continuously.
- 5. Test for spillage at the draft hood relief opening after 5 minutes of main burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar, or pipe.

- 6. After it has been determined that each appliance remaining connected to the common venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas-burning appliance to their previous conditions of use.
- 7. If improper venting is observed during any of the above tests, the common venting system must be corrected.

#### Venting Troubleshooting Procedures

TABLE 2A

Symptoms	Possible Causes	How To Check And/Or Correct
Downdrafting through	Negative pressure within	Check for downdraft in vent where vent connects to unit with

	without capping off the	it may allow too much cold air in and around the vent pipe
	chinney	allowing the flue products to condense causing condensation back at the unit.

#### **Vent Configurations**

- 1. Vent connectors serving Category I and Category II appliances shall not be connected into any portion of mechanical draft systems operating under positive pressure.
- 2. For Category II, III, and IV furnaces, the venting system shall be installed in accordance with the furnace manufacturer's installation instructions.

This furnace removes both sensible and latent heat from the combustion flue gases. Removal of latent heat results in condensation of flue gas water vapor. This condensed water vapor drains from the secondary heat exchanger into a 29-4C stainless steel drain pan. The condensate exits the drain pan by means of 3/8 I.D. vinyl hose. See Figures 8 and 8A.

This furnace must be vented to the outdoors with either 2 inch round or 3 inch round PVC (poly-vinyl chloride) or CPVC (chlorinated poly-vinyl chloride) schedule 40 vent pipe unless local codes do not allow PVC or CPVC. See Table 3 for vent size selection. The following substitutes are permitted, only when approved by and installed in accordance with local codes. Polypropylene (PP), Polyethylene (PE), Polybutylene (PB) and Accylonitrile-Butadiene-Styrene (ABS).

TABLE 3 PROPER VENT SIZE SELECTION

I		**
Furnace Models	Vent Length	Vent Diameter
CHO60D36B, CCO60D36A	3 - 60 Ft.	2" PVC
CHO80D48B,CC080D48A	(1) 3 - 20 Ft.	2" PVC
	* 3 - 60 Ft.	3" PVC
CH100D60B, CC100D48A	3 - 60 Ft.	3" PVC

Vent length given is in equivalent foot measurements. Refer to Item 1, General Instructions.

- \*If vent length is 20 to 60 equivalent feet, 3" must be run the entire length to the furnace.
- (1)For horizontal vents to <u>west</u> or <u>north</u> side of building, 3" PVC (for entire length from furnace to vent terminal) is recommended for equivalent lengths exceeding 10 feet to <u>minimize</u> possible nuisance actuation of pressure switch during high and/or erratic wind conditions.

IMPORTANT NOTE

For <u>horizontal</u> vent systems see special <u>vent termination</u> information on Page 10.

When substitute piping is used, it must be connected to the furnace at the no-hub connector located inside the furnace vestibule. See Figure 1. All joints, fittings, etc. must be cemented, sealed, or mechanically connected to prevent leakage of flue gases.

This vent must be in accordance with Part 7, Venting of Equipment, of the National Fuel Gas Code, ANSI Z223.1-latest edition, and Addenda Z223.1a-latest edition, or applicable previsions of the local building codes.

CAUTION

Each vent must serve only one furnace. Do not connect vent to existing vent or chimney.

## **General Instructions**

1. The maximum vent length is 60 total equivalent feet with each 45 degree elbow counting as 2-1/2 feet and each 90 degree elbow counting as 5 feet. Do not count the elbow within the furnace cabinet in this measurement.

Example: 20 feet of straight vent pipe with 3 - 90 degree elbows equals 35 equivalent feet.

- 2. Minimum horizontal vent length is 3 feet and 1 elbow.
- 3. A maximum of 5 elbows permitted in the vent run.
- 4. Vent diameter must not be reduced.
- 5. All horizontal runs must slope upwards not less than 1/4 inch per foot from the furnace to the vent terminal.

NOTE: Blbows used to change from a vertical run to a horizontal run should be DWV type to provide the correct slope in the horizontal run. If other types of elbows are used, then 2 - 45 degree elbows should be used in place of one 90 degree, with elbows slightly misaligned to provide slope in the horizontal runs.

- 6. All horizontal vent pipe runs must be supported at least every 4 feet with metal pipe strapping. No sags or dips or low spots are permitted.
- 7. All vertical vent pipe runs must be supported every 4 feet where possible.

- 8. Do not install the vent pipe in the same chase with a vent from another gas or other fuel burning appliance.
- 9. Do not install the vent pipe within 6 inches of the vent pipe from another gas or other fuel burning appliance.
- 10. The vent pipe can be run in the same chase or adjacent to supply or vent pipe for water supply or waste plumbing.
- 11. The vent pipe must be insulated if there is any chance of condensate freezing inside the pipe. This can occur if the vent pipe passes through an unconditioned space such as attic, crawl, uninsulated chase or a masonry chimney. It can also occur where the vent terminates above the roof or if an exterior vertical riser (Figure 2) is used to get above snow levels. Local climatic conditions and vent length must be considered. If vent height above roof exceeds 30 inches because of snow accumulation it must be insulated.

#### Types Of Insulation

#### FOR INDOOR OR OUTDOOR USE

Armaflex closed cell foam or equal. Recommended thickness is one inch. Additional layers may be required for extreme cold climate conditions.

#### FOR INDOOR USB ONLY

Fiberglass insulation with vapor barrier, or equal. Recommended thickness of 1 inch up to 10 feet. 2 inch thickness if unconditioned exposure exceeds 10 feet.

#### Connecting Vent to Furnace

The furnace is shipped from the factory with a 2" PVC street ell installed in the furnace vestibule. This is the point where field connection is made.

#### UPFLOW MODELS--CH SERIES

- 1. Cut a piece of 2" PVC pipe 21" long and connect one end to the 2" street ell located inside the furnace vestibule.
- 2. Attach 2" no-hub connector just above the top panel of the furnace. See Figure 1 for upflow. This fitting will help support the weight of the vent system.
- 3. If 3" vent is required (see Table 3) it is at this point where the vent should be increased. Cut a 3" length of 2" PVC and insert one end into the open end of the no-hub connector. Install a 2" x 3" PVC reducer on the top of the 2" nipple. Run the 3" PVC from this point on to the point of termination. See Figure 3A.

#### DOWNFLOW MODELS--CC Series

- 1. Cut a piece of 2" PVC pipe 40-3/4" long. Slide one end through top of cabinet and through the hole in the blower base and into the 2" street ell located inside the furnace vestibule.
- 2. Attach 2" no-hub connector just above the top panel of the furnace. See Figure 3 for downflow. This fitting will help support the weight of the vent system.
- 3. If 3" vent is required (see Table 3) it is at this point where the vent should be increased. Cut a 3" length of 2" PVC and insert one end into the open end of the no-hub connector. Install a 2" x 3" PVC reducer on the top of the 2" nipple. Run the 3" PVC from this point on to the point of termination. See Figure 3A.

#### ALL MODELS

A typical vent installation is shown in Figure 4.

- A. When vent penetrates through the roof and is brought above anticipated snow level, it is recommended that the pipe be cut off on a 45 degree angle. This will help prevent freezing and blockage of the vent system.
- B. If necessary to insulate vent pipe and a chimney is used as a chase, the top of the chimney must be sealed flush, or crowned up, so only the vent pipe protrudes.

## Joining Pipe and Fittings

All pipe, fittings, solvent cement, primers and procedures must conform to American National Standard Institute and American Society for Testing and materials (ANSI/ASTM) standards.

Pipe and Fittings--ASTEM D1785, D2466 & D2665 PVC Primer and Solvent Cement--ASTM D2564 Procedure for Cementing Joints Ref ASTM D2855.

#### WARNING

## DANGER OF FIRE OR BODILY INJURY

PVC SOLVENT CEMENTS AND PRIMERS APE HIGHLY FLAMMABLE. PROVIDE ADEQUATE VENTILATION AND DO NOT ASSEMBLE NEAR HEAT SOURCE OR OPEN FLAME. DO NOT SMOKE.

AVOID SKIN OR BYE CONTACT. OBSERVE ALL CAUTIONS AND WARNINGS PRINTED ON MATERIAL CONTAINERS.

All joints in the PVC vent must be properly sealed using the following material and procedure.

#### CAUTION

#### FOR PROPER INSTALLATION:

DO NOT use solvent cement that has become curdled, lumpy or thickened.

DO NOT thin. Observe shelf precautions printed on containers.

For application below 32 degree F use only low temperature type solvent cement.

## PVC Cleaner-Primer And PVC Medium Body Solvent Cement

- 1. Cut pipe end square, remove ragged edges and burrs. Chamfer end of pipe, then clean fitting socket and pipe joint area of all dirt, grease or moisture.
- 2. After checking pipe and socket for proper fit, wipe socket and pipe with cleaner-primer. Apply a liberal coat of primer to inside surface of socket and outside of pipe. DO NOT ALLOW PRIMER TO DRY BEFORE APPLYING CEMENT.
- 3. Apply a thin coat of cement evenly in the socket. Quickly apply a heavy coat of cement to the pipe end and insert pipe into fitting with a slight twisting movement until it bottoms out.

NOTE: Cement must be fluid, if not, recoat.

- 4. Hold the pipe in the fitting for 30 seconds to prevent the tapered socket from pushing the pipe out of the fitting.
- 5. Wipe all excess cement from the joint with a rag. Allow 15 minutes before handling. Cure time varies according to fit, temperature and humidity.

NOTE: Stir the solvent cement frequently while using. Use a natural bristle brush or the dauber supplied with the can. The proper brush size is one inch.

#### Horizontal Vents

The furnace may be vented horizontally through an outside wall, using all of the applicable instructions under Vent Pipe Installation with these additional requirements. The requirements and limitations for Horizontal Venting are very strict. ALL HORIZONTAL VENT INSTALLATIONS MUST BE MADE IN ACCORDANCE WITH THESE INSTRUCTIONS.

## Vent Location

The vent location must meet the requirements listed in the following instructions or applicable codes, whichever specifies the most clearance or strictest limitations.

#### CAUTION

THE COMBUSTION PRODUCTS AND MOISTURE IN THE FLUE GASES MAY CONDENSE AS THEY LEAVE THE TERMINAL ELBOH. THE CONDENSATE MAY FREEZE ON THE EXTERIOR WALL, UNDER THE EAVES AND ON SURROUNDING OBJECTS. SOME DISCOLORATION TO THE EXTERIOR OF THE BUILDING MAY OCCUR.

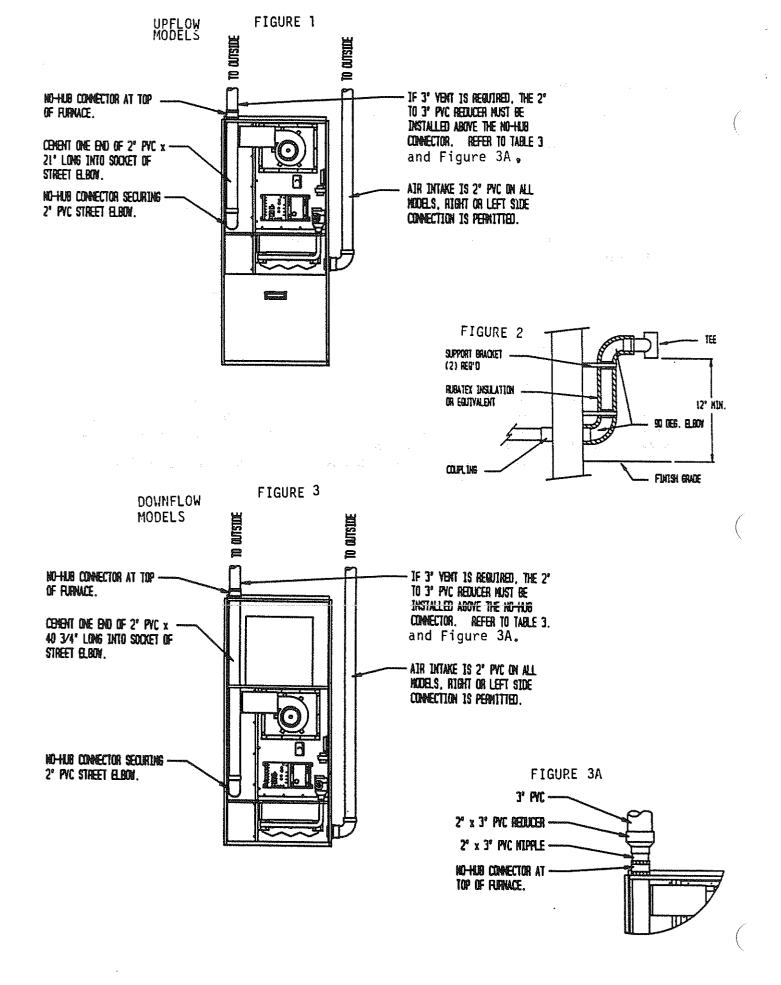

## Location Requirements

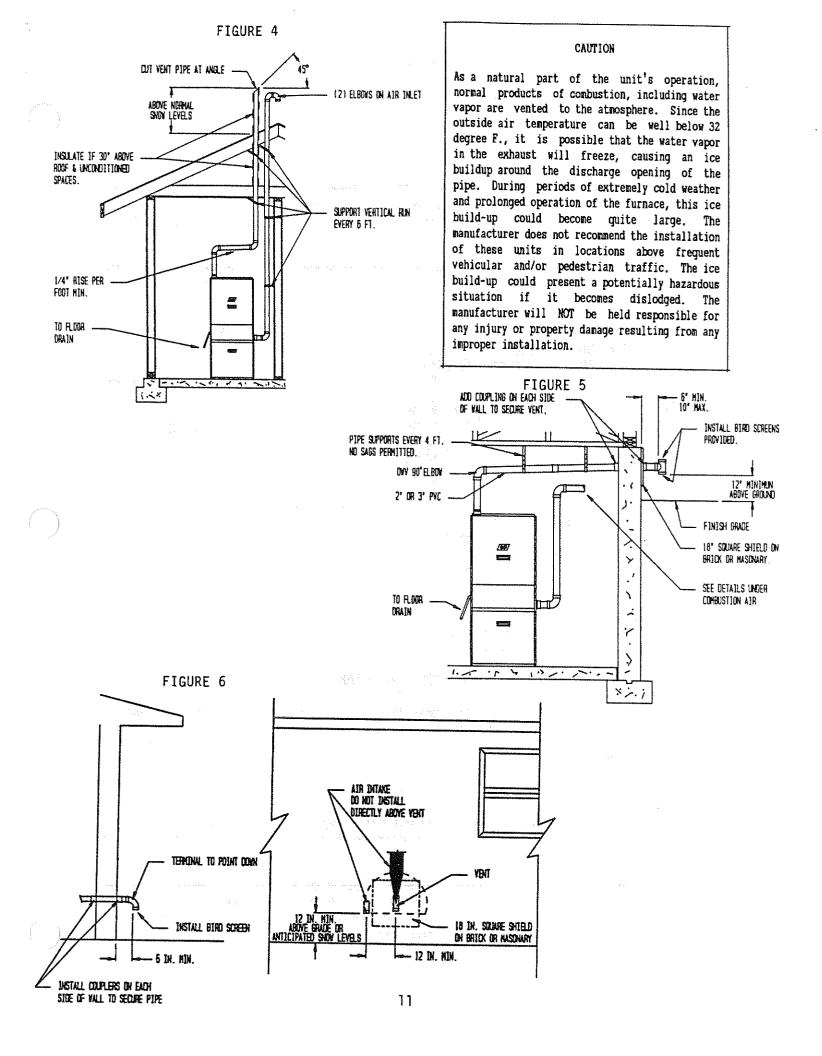

The vent must be installed with the following minimum clearances and requirements.

inches above ground level, above normal snow levels (when practical) and 6 inches out from the wall.
 Figure 5.

NOTE: Ice or snow may cause the furnace to shut down if the vent becomes obstructed. If required use a vertical riser or shield vent to prevent blockage from drifting snow. See Figure 2.

- 2. Not above the walkway or area that may create a hazard or nuisance or be detrimental to the operation of other equipment.
- 3. 4 feet from and not above or below any door, window, gravity inlet or forced air inlet for the building.
- 4. At least 4 feet from any soffit or under eave vent.
- 5. Do not vent under any kind of patio or deck.
- 6. Locate vent on the side of the building away from prevailing winter winds when practical but taking into consideration other limitations to determine the best overall location. If installed on a side with prevailing winds, consider the possible effects of moisture damage from freezing on walls or overhangs (under eaves) and use protective measures such as shielding and/or sealing cracks, seams and joints but extend area of sealing to minimum of 6 feet. On masonry surfaces, use a rust resistant shield (18" square) behind vent. If a vertical rise is used, the shield must extend 9" above and 9" below as shown in Figure 5. Shield can be wood, plastic, sheet metal, etc.

- 7. Do not locate too close to shrubbery as condensate may stunt or kill them.
- 8. Caulk all cracks, seams, and joints within 3 feet of vent.

A typical horizontal vent installation is shown in Figure 5.

## Vent Termination

The vent termination will consist of either a 2" or 3" PVC tee, dependent upon vent size. See Table 3A below. The tee is to be a minimum of 6" and a maximum of 10" out from the wall and 12" above finish grade. See Figure 5. Bird screens are provided and are to be installed in both the top and the bottom of the tee. The tee should be installed in vertical position.

To exit the structure, a round hole is to be cut large enough to accommodate the pipe, yet smaller than the coupling so that a coupling installed on each side of the wall will prevent the vent pipe from being pulled out or pushed in the wall. See Figure 5.

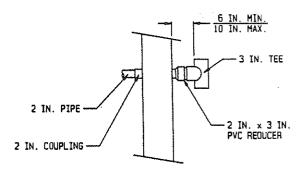

TABLE 3A
VENT TERMINAL SIZING CHART

Model	Vent Length*	Vent Diameter	Vent Terminal
CHO60D36B	3-60	2" PVC	2" PVC Tee
CC060D36A			
CHO80D48B	3-10	2" PVC	2" PVC Tee
CC080D48A	(1) 3-20	2" PVC	(2)3" PVC Tee
	(3) 3-60	3" PVC	3" PVC Tee
CH100D60B	3-60	3" PVC	3" PVC Tee
CC100D48A			18.3

\*Equivalent feet.

- (1)For horizontal vents to west or north side of building, 3" PVC (for entire length from furnace to vent terminal) is recommended for equivalent lengths exceeding 10 ft.to minimize possible nuisance actuation of pressure switch during high and/or erratic wind conditions.
- (2)2" x 3" reducer is used on tee side (outside) of wall, see Figure 6A.
- (3) If yent length is 20 to 60 equivalent feet, 3" pipe must be run the entire length to the furnace.

FIGURE 6A

#### COMBUSTION AIR INTAKE

This furnace is intended to use outside air for combustion. Failure to connect the air intake to the outside may result in premature failure of the heat exchanger. Figures 1 and 4 show a typical air intake connection. Connection of the air intake is a requirement for limited lifetime warranty of primary and secondary heat exchangers be in effect.

When installing the air intake, these guidelines must be followed.

- The air intake may be connected to either the left side or right side of the furnace cabinet using the adapter and locknut shipped with the unit. The unused opening in the cabinet is to be plugged with the large hole plug supplied.
- 2. The air intake pipe is 2" PVC. The minimum horizontal length of the air intake is 3 equivalent feet and one elbow, the maximum length is 60 equivalent feet, with each 45 degree elbow counting as 2-1/2 feet and each 90 degree elbow counting as 5 feet (refer to Venting, General Instructions for example). Do not count the 90 degree elbow at the furnace side in this measurement.

- 3. The air intake terminal must be at least 12 inches away from the vent terminal, 6 inches out from the wall, and not directly above the vent terminal. See Figure 6.
- 4. Air intake terminal must be 12" above ground or above anticipated snow levels.
- 5. The bird screen supplied is to be installed into the end of the 90 degree elbow (see Figures 4 and 6).
- 6. Follow rules under venting for joining pipe and fittings.
- 7. On vertical intake, two 90 degree elbows must be used at the terminal to prevent moisture from entering the air intake (see Figure 4).
- 8. On horizontal air intakes one 90 degree elbow must be used on the termination. This elbow must point down to prevent moisture from entering the air intake (see Figure 6).
- 9. Attach couplings on each side of the wall to prevent pipe from being pushed in or pulled out.
- 10. Do not take the combustion air from the crawl space or attic space.

## CONDENSATE DRAIN

The drain tubing that is provided with this unit is for the purpose of removing condensation from the furnace. A condensate trap is required for operation and is easily obtained when installed as shown in Figure 8 and 8A. The drain line should slope "downhill" to the drain after exiting the furnace cabinet. Excessive condensate trap (long uphill and/or level runs) can cause the furnace to malfunction.

#### UPFLOW MODRLS

The drain tubing supplied with the <u>up-flow</u> versions measures 3/8" 1.D.  $\times$  1/2" 0.D.  $\times$  60" long and is a clear PVC flex tubing. See Figure 8 for left or right side side drain options.

#### DOWNFLOW MODBLS

The silicone tubing which is supplied with the <u>down-flow</u> models measures 3/8" I.D. x 5/8" 0.D. x 36" long and is to be used within the confines of the burner compartment. Two wire ties, supplied in the installation parts kit provided with each unit, are used to secure the silicone drain tubing to the lower base. Slide the wire ties through dimple holes in the base and loop around drain line as shown on drain installation instructions provided with the installation parts kit. Once the silicone drain tubing has exited the cabinet, the PVC flex tubing measuring 3/8" I.D. x 1/2" 0.D. x 30" long may be used to reach the drain. A 3/8" barbed hose coupling which is also provided may be used to couple the silicone drain tube and the PVC drain tube together. Schedule 40 PVC pipe may also be used once outside the cabinet. See Figure 8A for left or right side drain options.

#### CAUTION

Do not run drain to an area where temperature may drop below freezing point (32 degree F). Freezing of condensate could result in property damage or furnace malfunction.

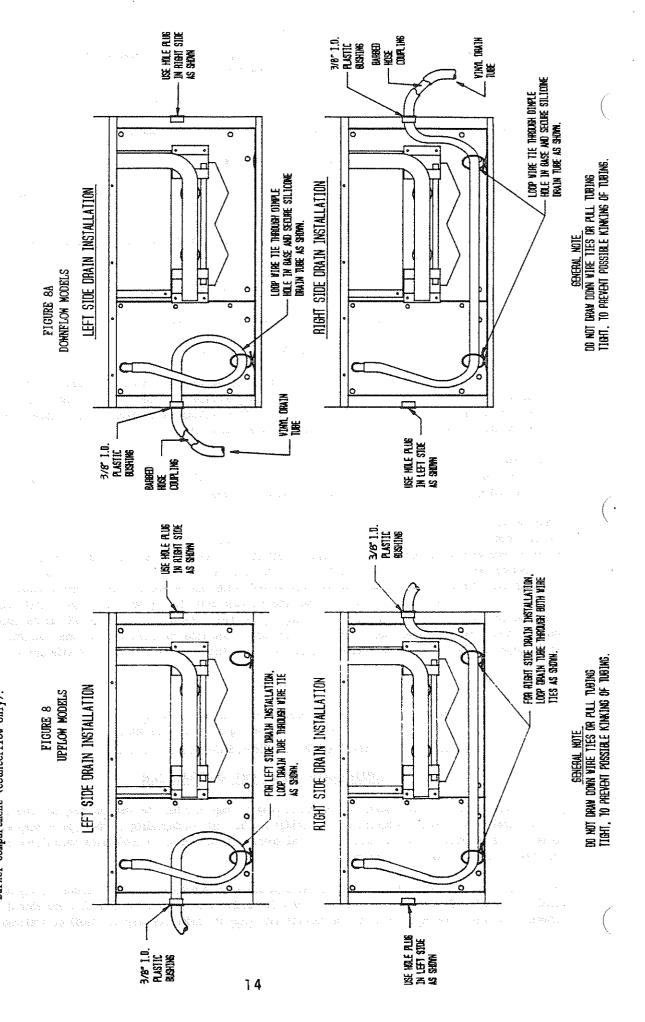

#### CONDENSATE PUMP AND NEUTRALIZER

If no floor drain is available, a condensate pump or sump pump must be used for pumping condensate to the nearest drain. A condensate neutralizer cartridge may be required depending on the type of pump and/or local codes. If a condensate pump is used, or if local codes require, install a condensate neutralizer cartridge in the drain line as it exits the furnace.

Neutralizer part No. 8620-031 can be ordered separately as an option. It has a barbed fitting on both ends sized for 3/8" I.D. tubing. It can be installed either vertically or horizontally and should be located somewhere in drain line <u>after</u> it exits the furnace and <u>ahead</u> of condensate pump (if used) or drainage system.

Vinyl drain tube measures 3/8" I.D. x 1/2" 0.D. x 30" long for counterflow and 60" long for upflow units, and is clear in color. This tubing is to be used externally to the cabinet for counterflow models and within the confines of the cabinet for the upflow models.

36" long and is translucent in color. This tubing is to be used within the confines of × Silicone drain tube measures 3/8" I.D. x 5/8" 0.D. burner compartment (counterflow only)

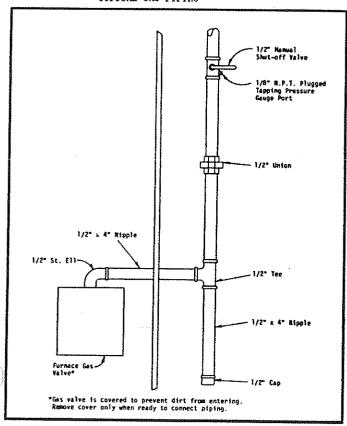

#### GAS SUPPLY AND PIPING

### General Recommendations

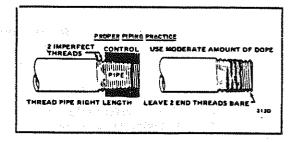

- 1. Be sure the gas line complies with the local codes and ordinances, or in their absence with National Fuel Gas Code, ANSI Z223.1-latest edition.
- 2. A sediment trap or drip leg must be installed in the supply line to the furnace,
- 3. A ground joint union shall be installed in the gas line adjacent to and upstream from the gas valve and downstream from the manual main shut-off valve.
- 4. A 1/8" N.P.T. plugged tapping accessible for test gauge connection shall be installed immediately upstream of the gas supply connection to the furnace for the purpose of determining the supply gas pressure.
- 5. A manual shut-off valve shall be installed in the supply gas line external to the furnace when required by local code. See Figure 7.
- 6. Use steel or wrought iron pipe and fittings.
- 7. DO NOT thread pipe too far. Valve distortion or malfunction may result from excess pipe within the control. Use pipe joint compound resistant to the action of liquified petroleum gases on male threads only. DO NOT use Teflon tape. See illustrations.
- 8. Refer to Tables 4 and 5 for Gas Pipe Sizes for Natural and L.P. gas. If more than one appliance is supplied from a single line size, capacity must equal or exceed the combined input to all appliances, and the branch lines feeding the individual appliances properly sized for each input.

FIGURE 7

#### TYPICAL GAS PIPING

LENGTH OF STA	LENGTH OF STANDARD PIPE THREADS (Inches)

Nat. L.P.	4.5" 11.0"	11.0" 13.0"	3.5" 10.0"								

Measured in inches water.

## Checking The Gas Piping

Before turning gas under pressure into piping, all openings from which gas can escape should be closed. Immediately after turning on gas, the system should be checked for leaks. This can be done by watching the 1/2 cubic foot test dial and allowing 5 minutes to show any movement, and by soaping each pipe connection and watching for bubbles. If a leak is found, make the necessary repairs immediately and repeat the above test. The furnace must be isolated from the gas supply piping system by closing the manual shutoff valve on the combination gas control valve during pressure testing of the gas supply piping system at pressures up to 1/2 psig. The furnace must be disconnected from supply piping and supply piping capped during any pressure testing of supply piping system at test pressure in excess of 1/2 psig.

Defective pipes or fittings should be replaced and not repaired. Never use a flame or fire in any form to locate gas leaks, use a soap solution.

After the piping and meter have been checked completely, purge the system of air. DO NOT bleed the air inside the furnace. Be sure to relight all the gas pilots on other appliances that may have been extinguished because of interrupted gas supply.

\*Copper tubing for gas supply must comply with limitation in National Fuel gas Code, reference "2.6.3 Metallic Tubing".

#### WIRING

#### CAUTION

For your personal safety, turn off electric power at service entrance panel before making any electrical connections.

All electrical work must conform with local codes and ordinances, or in their absence, with the National Electrical Code, ANSI/NFPA 70-latest edition.

## Electrical Power Supply

Run a separate 120 volt, AC circuit from a separate fuse or circuit breaker in the service entrance panel with an ampacity rating as shown in Table 6. Locate a shut off switch at the furnace. Make connections from this switch to the furnace junction box as shown in the furnace wiring diagram.

<sup>\*\*</sup>Outside diameter.

25 amp

# **Electrical Grounding**

CCO80D48A CH100D60B

115/60/1

13.4

#### A. RECOMMENDED GROUNDING METHOD

When installed, the furnace must be electrically grounded in accordance with local codes or in the absence of local codes, with the National Blectrical Code, ANSI/NFPA No. 70-latest edition. Use a #14 AWG copper wire from green screw or green ground wire on the furnace to a grounded connection in the service panel or a properly driven and electrically grounded ground rod.

#### **THERMOSTAT**

Install the thermostat in accordance with instructions packed with it. Locate the thermostat 4-1/3 feet from the floor on an inside wall away from drafts, warm air registers and floor or table lamps. Refer to furnace wiring diagrams for connections.

All 24V wall thermostats have heat anticipators to compensate the thermostat for various system controls and allow the best possible cycle rates. Some anticipators are fixed and require no adjustment. However, the majority of wall thermostats have adjustable anticipators and do require adjustment to match the current rating of the thermostat circuit. Nominal rating of thermostat circuit is .80A, however, actual amp draw through the thermostat should be checked to determine heat anticipator setting.

Failure to adjust the anticipator lever to correspond to the actual current draw through the thermostat will cause severe short cycling if set too low and room temperature may never attain the thermostat set point, and if set too high, will cause room temperature to overshoot the set point.

#### **BLOWER OPERATION**

All models are three or four speed direct drive and are equipped with a heating-cooling blower relay. When matched with the appropriate wall thermostat, offers manual blower operation from the wall thermostat for air circulation.

#### CAUTION

After the furnace is operating with filters installed and all cabinet panels are in place, check the temperature rise through the unit to insure it is within the range specified on the furnace rating plate. If it is not, adjust blower speed until the temperature rise is within specified range.

## Field Installed Equipment

Wiring to be done in the field between the furnace and devices not attached to the furnace, or between separate devices which are field installed and located, shall conform with the temperature limitation for Type T wire (63 degree F rise (36 degree C)) when installed in accordance with the manufacturer's instructions. Refer to wiring diagrams.

### **FILTERS**

All models are shipped with filters. See Table 7 for sizes. Hi-Boy Models have the filters in their intended positions. Hi-Boy models are shipped with filter on the left side. They can alternately be located on right side or bottom. See following information. The counterflow models require a bracket installation and final filter location projects into return air plenum attachment to furnace. See Figure 10A.

<sup>\*2-16</sup>x25xl for 5 tons of cooling.

## Filter Locations--Removal and Replacement Procedures--All Hi-Boy Furnaces

To remove filters from ALL sectional Hi-Boys, remove the lower blower compartment door by grasping the handle in the door and pull up and away from the furnace. Then, remove the "S" clip and spring by pulling the clip towards front of the furnace.

For right hand side filter location, relocate filter and retaining spring assembly to right side filter brackets.

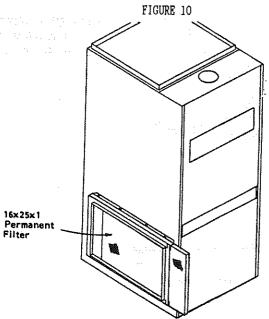

The filter may now be removed simply by pulling it towards the center of the furnace and outward.

The location may vary, depending on which side the installer located the return air duct.

This filter is the permanent high velocity type foam filter which may be washed and used over and over. DO NOT replace it with a fiberglass filter of the same size.

To replace filter, reverse the above process.

To remove filter from the optional external filter rack, grasp the exposed end of the filter and pull from the filter rack.

The location may vary, depending on which side the installer located the return air duct.

This filter is the permanent high velocity type foam filter which may be washed and used over and over. DO NOT replace it with a fiberglass filter of the same size.

To replace filter, reverse the above process.

## Alternate Bottom Filter Location

All Hi-Boy models have a removable panel on the base for a bottom return air installation.

To utilize this feature, remove the fill plate by bending the four tabs up 90 degrees. Relocate filter retainer spring from side to bottom brackets. Leave the four tabs bent in the upright position as they will now serve to keep the filter positioned left to right.

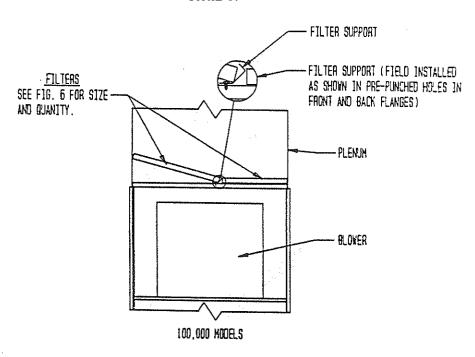

## Five Ton Cooling Capacity

If the model CH100D60B is used with 60,000 BTU cooling capacity, then 2 return air openings are required. This can be accomplished by using both sides of the furnace or one side and the bottom return. The furnace is shipped with one 16x25 permanent filter, one additional filter is required for this application.

## Filter Locations--Counterflow Models

Counterflow models normally have filters installed in the return air plenum above the furnace unless a common return air/filter grille is used. Refer to figures 10A and 10B for suggested filter locations.

# FOR YOUR SAFETY READ BEFORE OPERATING

WARNING: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

- This appliance is equipped with an ignition device which automatically lights the pilot. Do not try to light the pilot by hand.
- BEFORE OPERATING smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS

Do not try to light any appliance.

 Do not touch any electric switch; do not use any phone in your building.

 Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.

- If you cannot reach your gas supplier, call the fire department.
- C. Use only your hand to push in or turn the gas control knob. Never use tools. If the knob will not push in or turn by hand, don't try to repair it, call a qualified service technician. Force or attempted repair may result in a fire or explosion.
- D. Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

# OPERATING INSTRUCTIONS

- 1. STOP! Read the safety information above on this 5. Remove control access panel.
- 2. Set the thermostat to lowest setting.
- 3. Turn off all electric power to the appliance.
- 4. This appliance is equipped with an ignition device which automatically lights the pilot. Do not try to light the pilot by hand.

- 6. Push in gas control knob slightly and turn clockwise to "OFF."

NOTE: Knob cannot be turned to "OFF" unless knob is pushed in slightly. Do not force.

- 7. Wait five (5) minutes to clear out any gas. If you then smell gas, STOP! Follow "B" in the safety information above on this label. If you don't smell gas, go to next
- 8. Turn gas control knob counterclockwise to "ON."
- 9. Replace control access panel.
- Turn on all electric power to the appliance.
- Set thermostat to desired setting.
- 12. If the appliance will not operate, follow the instructions "To Turn Off Gas To Appliance" and call your service technician or gas suppiler.

# TO TURN OFF GAS TO APPLIANCE

- 1. Set the thermostat to lowest setting.
- 2. Turn off all electric power to the appliance if service is to be performed.
- 3. Remove control access panel.

- 4. Push in gas control knob slightly and turn clockwise to "OFF." Do not force.
- 5. Replace control access panel.

7961-219

## SEQUENCE OF OPERATION

On a call for heat from the thermostat, the induced draft blower relay is energized through the normally closed contacts of the air proving pressure switch. At this point the induced draft blower starts its operation. Once sufficient draft is established, the ignition module is energized through the normally open contacts of the air proving pressure switch. The pilot ignition electrode will begin to spark and the pilot valve will be energized allowing pilot gas to flow. Upon establishment of the pilot burner flame, adequate flame for burner ignition is proved to the control module allowing the main gas valve is to be energized and to discontinue ignition spark. At the same time the main valve is energized, a one minute blower delay timer is activated.

After this delay, the low speed blower relay energizes. The blower will begin operating and remain in operation until two minutes after the call for heat has been satisfied. This timing sequence guarantees blower on, blower off operation.

### MAINTENANCE INSTRUCTIONS

The furnace and its vent system should be inspected annually by a qualified service agency, generally prior to the heating season.

NOTE: PRIOR TO THE START OF ANY OF THE FOLLOWING MAINTENANCE PROCEDURES SHUT OFF ALL POWER TO THE UNIT.

Routine maintenance procedures are the responsibility of the owner and are contained in the Owner's Manual. These are briefly outlined below:

- 1. <u>Air Filters</u>. Check the condition on at least a monthly basis when the furnace is in use or replace whenever it is necessary.
- 2. <u>Lubrication Requirements</u>. Direct drive motors are permanently lubricated, no maintenance required. The induced draft blower motor should be oiled every six months with SAE20 motor oil.
- 3. Periodic Inspection of the Vent and Air Intake. Visual inspection of the vent and air intake for any leaking, sags, dips or defective parts. The vent and intake should also be inspected outside of the structure for any blockage in the openings. If blockage is present, remove the bird screens and brush clean before putting them back in.
- 4. Periodic Inspection of Drain Line. The drain line on a condensing furnace should be checked monthly for blockage or freezing of drain condensate. Blockage of drain will prevent furnace operation.

### -- QUALIFIED TECHNICIANS ONLY--

#### Service Agency Procedures

The pilot flame can be adjusted by removing the pilot adjustment cover screw. Turn inner adjustment screw clockwise to decrease and counterclockwise to increase pilot flame. Be sure to replace cover screw after adjustment to prevent possible gas leakage.

Observe the main burners in operation. The flame should be mostly "blue" with possibly a little orange (not yellow) at the tips of the flame. The flames should be in the center of the heat exchanger compartments and not impinging on the heat exchanger surfaces themselves.

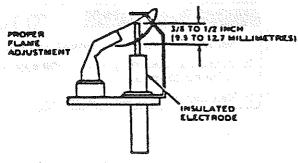

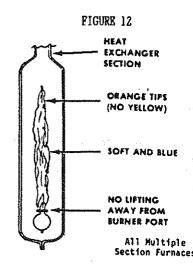

FIGURE 11

INTERMITTENT PILOT

The air shutters are factory adjusted completely open. If flashback occurs, the air shutters may be closed slightly to prevent the flashback.

Observe the fire until the blower starts (there is a normal delay period until the heat exchanger warms up). There should be no change in the size or shape of the flame. If there is any wavering or blowing of the flame on blower start-up, it is an indication of a possible leak in the heat exchanger.

#### WARNING

Danger of property damage, bodily injury or death if electric power (at disconnect) and gas supply (at manual shutoff valve in gas line) are not shut off.

Inspect the burner assembly for any scaling, sooting or blockage of ports. If there are signs of this, the burner should be removed and cleaned with a wire brush until all soot and scale is removed and burner ports are not obstructed.

Check Temperature Rise--Adjust blower speed if necessary to obtain a temperature rise within the range specified on the furnace rating plate. See blower operation for details.

## Heat Exchangers and Flue Gas Passageways

Furnaces that are properly installed and maintained will normally not require cleaning of the heat exchangers.

THE ONLY TIME it should be necessary to disassembly and clean the interior of both the Primary and Secondary Heat Exchangers would be due a sooting condition caused by abnormal combustion.

The inside of the heat exchanger can be examined for scale and soot using a light and a mirror on an extension handle. If soot and/or scale is evident, the heat exchanger must be cleaned as follows:

- Remove burner assembly from inlet to heat exchanger.
- 2. Remove flue transition, combustion air blower, flue collector box and internal flue baffles from the outlet of the primary heat exchanger.
- 3. Using a small wire brush on extension handle brush inside walls of the heat exchanger until soot and/or scale is removed. The loose scale and/or soot is easily removed using a vacuum cleaner at the inlet side of the heat exchanger.
- 4. To clean the secondary heat exchanger, disconnect the 2 no-hub connectors securing the vent to the furnace. Remove the length of vent located in the furnace vestibule. Remove the 18 sheet metal screws securing the coil partition (partition located on left side when facing unit). Disconnect drain hose and remove burner partition. The secondary heat exchanger is now ready for removal.

- 5. Gently ease secondary heat exchanger straight forward away from back of furnace being careful not to damage the fins.
- 6. Once the coil is removed from the furnace, take it to a place where the following steps can be performed.
  - A. Set coil on its back so the inlet, outlet and drain openings are pointed up. Pour 2 quarts of hot water into the coil and cap off openings. Shake coil vigorously and pour out water. Repeat this procedure until the water being poured from the coil is clear.
  - B. Thoroughly wash off the exterior of the heat exchanger using a soft brush and a mild stream of water. DO NOT use a hard stream of water as this may damage the fins.

## REPLACEMENT PARTS

Replacement parts for the gas furnaces are available through local distributor.

Parts list covering all furnace components is shown in the Replacement Parts Manual. When ordering parts or making inquiries pertaining to any of the furnaces covered by these instructions, it is very important to always supply the COMPLETE model number and serial number of the furnace. This is necessary to assure that the correct parts (or an approved alternate part) are issued to the service agency.
