BARD MANUFACTURING COMPANY, INC.
BRYAN, OHIO  USA  43506
UNPACKING

Upon receipt of the equipment be sure to compare the model number found on the shipping label with the accessory identification information on the ordering and shipping document to verify that the correct accessory has been shipped.

Inspect the carton housing of each ventilator as it is received, and before signing the freight bill, verify that all items have been received and that there is no visible damage. Note any shortages or damage on all copies of the freight bill. The receiving party must contact the last carrier immediately, preferably in writing, requesting inspection by the carrier’s agent. Concealed damage not discovered until after loading must be reported to the carrier within 15 days of its receipt.

GENERAL

The ventilator should only be installed by a trained heating and air conditioning technician. These instructions serve as a guide to the technician installing the ventilator package. They are not intended as a step-by-step procedure with which the mechanically inclined owner can install the package.

The ventilator housing is shipped in one carton which contains the electrical harness, miscellaneous hardware and installation instructions.

DESCRIPTION

The WCRVPS* ventilator is designed to be used with the specific models with "letter" revision codes as designated on the front page of this installation instructions manual.

The ventilator is an electromechanical vent system designed to provide fresh air to meet indoor air quality standards.

MODELS

When installed in the models listed on the front page, the WCRVPS* provides built-in exhaust provisions. When the damper blade opens to bring fresh air in, the damper also opens an exhaust relief. The exhaust air will flow into the condenser section of the unit. The condenser fan will help draw exhaust air out when it is operating with compressor in cooling or heat pump mode.
INSTALLATION OF FIELD-INSTALLED WCRVPS*

BASIC INSTALLATION

**WARNING**

*Electrical shock hazard.*  
*Disconnect remote electrical power supply or supplies before servicing.*  
*Failure to do so could result in electric shock or death.*

Preparing Unit for WCRVPS* Installation

1. Disconnect power to unit.
2. Unpack the WCRVPS* assembly, which includes the integral controls and electrical harness, body panels, miscellaneous hardware and installation instructions.
3. From existing wall mount unit, remove and save (or discard) as directed (see Figure 1):
   - Ventilation option panel (discard)
   - Filter access panel (discard)
   - Filter (save)
   - Outer and inner control panel doors (save)
   - Filter tray (discard, if applicable)
4. Remove and discard the exhaust cover plate.
5. Install new condenser exhaust plate with screen over opening into condensor section (see Figure 2).
6. Remove filter brackets, if necessary. Two types of filter brackets have been used with these wall mount units. If the filter brackets are mounted flat, they can be used with the commercial room ventilator (CRV). If the brackets are set at a 30° angle, they must be removed and discarded. The circuit breaker offset plate must be loosened and moved slightly to gain access to several of the screws holding the filter brackets in place. Tighten the screws holding control panel after the filter brackets have been removed.

**FIGURE 1**

Wall Mount Unit Access Panels

![Wall Mount Unit Access Panels Diagram](MIS-3818)
If filter brackets were removed in Step 6, proceed to Step 7. If the brackets were not removed, proceed to Commercial Room Ventilator (CRV) Installation on page 7.

7. Install filter bracket fill plate (if applicable) as shown in Figure 3 on page 6.

8. Install provided filter brackets on WCRVPS* assembly (see Figure 3).

MIS-3814
Commercial Room Ventilator (CRV) Installation

1. Installed onto the WCRVPS* are two 12-pin extension jumpers. One is 12" in length for right-hand models and the other is 72" in length for left-hand models. Lock the appropriate length jumper into the corresponding lower tab on the front of the ventilation package (see Figure 4).

2. Insert CRV into opening in the wall mount unit between the filter rack and the condenser section, being careful not to tear the unit insulation. Fully seat CRV assembly to rear of the cavity. Slide the CRV toward the control panel so that it lines up with the return air opening in the rear of the wall mount unit (see Figure 5 on page 8).

3. Insert and lock in the 12-pin extension cable installed in Step 1 into the front side of the control panel within the ventilation package section.

4. Replace the air filters if they were removed (airflow direction is up).

5. The next step involves installing the lower service panel, filter access cover and hood assembly that are included in the WCRVPS* package. The front slotted vent hood cover and mist eliminator filter must be removed to access several mounted screws located behind them. Replace the mist eliminator and vent hood cover after the lower service panel, filter access cover and hood assembly have been installed (see Figure 6 on page 8).

6. Remove the vent control panel cover on the right-hand side of the vent hood.

7. Make all the required thermostat connections per the applicable connection diagram found on pages 11 or 12, and restore power to the unit.

8. Make any necessary changes required to the potentiometers to achieve the minimum continuous airflow and demand airflow desired.

FIGURE 4
Extension Cable Installation

SECURE LEFT-HAND WIRE HARNESS WITH CABLE TIE PART #7950-012.

ON LEFT-HAND MODELS, ROUTE THE 72" LONG 12-PIN EXTENSION CABLE ACROSS THE TOP OF THE DAMPER ASSEMBLY. CABLE WILL NEED TO GO UNDER THE CENTER SUPPORT BAR.

ROUTE LEFT-HAND WIRE HARNESS ACROSS VENT PACKAGE AS SHOWN, SECURING THE TWO WIRE LOOMS TOGETHER WITH CABLE TIE PART #7950-004.

KNIFE SLIT INSULATION AT EACH SIDE.

ON RIGHT-HAND MODELS, INSERT THE 12" LONG 12-PIN EXTENSION CABLE INTO THIS PORT. PLUG OTHER END OF CABLE INTO FRONT SIDE OF UNIT CONTROL PANEL.

ON LEFT-HAND MODELS, INSERT THE 72" LONG 12-PIN EXTENSION CABLE INTO THIS PORT AND ROUTE ACROSS VENTILATION PACKAGE. PLUG OTHER END OF CABLE INTO FRONT SIDE OF UNIT CONTROL PANEL.
After sliding the vent package into the wall mount, slide it toward the control panel side aligning it with the return air opening in the rear.

**FIGURE 6**
Vent Hood Assembly

- Insert (4) screws to hold door in place.
- (10) screws to seal between vent option & door.
- Hidden components for clarity.
- Jade controller location (WECO only).
- Plug in 12 pin jade controller connectors (WECO only).

**FIGURE 5**
Damper Assembly Installation

- Control panel (RH shown).
- The wire harness from this location on the vent package will plug into the front side of the control panel.
**CO₂ Control**

For CO₂-based control, add a CO₂ sensor/controller (Bard part #8403-067) to the wall and run additional optional wires as shown in the wiring diagrams on pages 11 and 12.

The CO₂ controller must also be reconfigured from the standard default settings as shipped from the factory. See page 13 for complete details.

**Control System Notes**

This ventilation package is set to meet the current ASHRAE specifications for minimum occupied airflow rates, with extended capability to meet demand ventilation requirements. There are two different provisions to optimize this control path. One is the utilization of switch closures (occupancy and CO₂ demand) and the other is the utilization of occupancy (switch closure) and modulating CO₂.

**Two Switch Application**

Energizing the A terminal in the low voltage connection box during occupied conditions will allow the minimum occupied airflow rate to be set to meet ASHRAE requirements. This can be accomplished by adjusting Potentiometer R1 on the CRV control board by aligning the damper position per the charts included on pages 14-16 (see Figure 7 on page 10). The factory default blade position for this condition is set to position 3.

Energizing Terminal 5 in the low voltage connection box will then drive the damper open to the CFM rate as set by Potentiometer R2 on the CRV control board (see Figure 7). Refer to the proper chart on pages 14-16 for the airflow to damper position correlation. The factory default blade position for this condition is set to position 4.5.

**Modulating CO₂ Control**

Wire the R power wire of the CO₂ control to A of the low voltage terminal block, then energize A based upon occupancy.

Connect the brown/white wire that is landed on the PARK terminal in the CRV control board to the OCC terminal of the CRV control board.

Once things are powered up and the CO₂ control has equalized, adjust Potentiometer R7 to the minimum damper open position to yield the desired occupied airflow rates. The CO₂ control will then take over in modulating the damper position to maintain the proper CO₂ rates.
POT "R2" ADJUST DEMAND VENTILATION WHEN NON-MODULATION CO2 CONTROL SCHEME IS UTILIZED

POT "R1" ADJUST MINIMUM OCCUPIED AIRFLOW WHEN non-modulation CO2 control schematic is utilized

POT "R7" ADJUST MINIMUM OCCUPIED AIRFLOW. CAN ONLY BE SET WHEN CO2 CONTROL IS READING BELOW 700 PPM

When utilizing modulating CO2 control, the brown/white wire needs to move from the "park terminal" to the "occ terminal" on the CRV control board.
FIGURE 8
Required Control Connections for CRV with Air Conditioners

- Completestat
  - Model #CS98B-THO
  - Model #CS98B-E-THO

- Thermostat Bard #8403-060

- 24VAC
- CO2 OUT
- TEMP-OUT

Factory installed jumper. Remove jumper and connect to N.C fire alarm circuit if emergency shutdown required.

1. Not needed below 15KW.
2. Additional wire required for dehumidification models.
3. Demand ventilation control, which could include switched CO2 control, or secondary motion activated switch. Would be negated with option 7 (CO2 with 0-10VDC modulating output)
4. Install a jumper between "G" and "A" only when thermostat without "Occupancy Signal" is used.
5. Relay Provided with Completestat
6. 0-10 VDC Modulating CO2 control for modulating ventilation control
7. MIS-3726

(1) Damper should be at the required minimum occupied ventilation rate when the CO₂ control is at 700 ppm. Potentiometer R7 can be adjusted clockwise (CW) to close it down, or counter clockwise (CCW) to open it to the required setpoint.

(2) Blade as referenced to the Blade Position Label.
BLADE ADJUSTMENT FOR DESIRED VENTILATOR AIR

The amount of ventilation air supplied by the commercial room ventilator is dependant on four factors.

1. Return air duct static pressure drop.
2. Supply air duct static pressure drop.
3. Indoor blower motor speed.
4. Damper blade open position setting.

Refer to the appropriate graph below and on the following pages to determine the blade setting necessary to achieve the ventilation air required for each operating mode.

Factory Default Settings

Potentiometer R1: 3
Potentiometer R2: 6

For more accurate adjustment, use a flowhood over the intake opening to measure and adjust the airflow operation.

Potentiometer R1 Adjusts the minimum constant airflow during occupied conditions
Potentiometer R2 Adjusts the airflow on a contact closure for demand ventilation

Energize occupied condition mode and adjust #1 Potentiometer to desired airflow.

Energize demand ventilation mode and adjust #2 Potentiometer to desired airflow.

Minimum damper position when using CO₂ control damper should be at minimum occupied airflow at 700 ppm or lower; if not, Potentiometer R7 can be adjusted clockwise (CW) to close it. If it is fully closed at 700 ppm or lower, no adjustments are required.

COMMERCIAL ROOM VENTILATOR

Features

- One piece construction – easy to install with no mechanical linkage adjustment required.
- Exhaust air damper – built in with positive closed position. Provides exhaust air capability to prevent pressurization of tight buildings.
- Actuator motor – 24 volt, power open, spring return with built in torque limiting switch.

Commercial Room Ventilator Sequence of Operation

On a call for occupied conditions, CRV opens to a position as set by #1 Potentiometer (see Figure 11).

**NOTE:** These sequence descriptions do not apply if CO₂ controller is used. The CRV will control according to observed CO₂ levels in the conditioned space. Refer to information on page 13.
